### Follow-up: where are we paying twice to serve the same customer?

---

Hi,

This came up in a working session and nobody had the same definition.

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: customers begin digitally and finish through an assisted channel; digital journeys are resolving customer needs; or a small set of broken journeys creates most repeat contact.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which journeys should be fixed before another channel-adoption campaign is funded. Please bring a one-page finding note plus the underlying CSV for our own review, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Thank you
