Follow-up: why are customers coming back to the branch?

Hi,

This came up in a working session and nobody had the same definition.

Regional managers suspect that statement requests, card problems and failed digital journeys are creating avoidable branch demand.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: customers prefer branch for complex needs; specific communications fail to explain the next step; or service failures drive repeat visits.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which demand should be removed, redirected or staffed differently. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. There is no branch queue-time or staff-roster table; infer demand drivers, not staffing productivity.

Thank you
