Follow-up: reconcile applications, booked loans and collections

Morning,

I need help with something that sounds simple but probably is not.

Risk, Lending and Reporting are counting applications, approvals, booked loans and distressed accounts from different starting populations. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

The questions I would ask in the room are:

1. What would we expect to see if booked loans are missing from downstream repayment views?
2. What evidence would instead support that workflow timing explains most differences?
3. How do we rule out that declined and withdrawn cases are mixed?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2022 as the new evidence point rather than recycling the earlier conclusion. Please work towards the canonical population and exception rules for the next return. A useful output would be a one-page finding note plus the underlying CSV for our own review.

Use the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context. One caution: Do not present this as an official regulatory return without the required regulatory taxonomy and sign-off.

Regards
