Follow-up: the timeout field is not an SLA report

Hi team,

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2022 as the new evidence point rather than recycling the earlier conclusion. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Can you test these explanations rather than choosing one at the start?

- repeat incidents create disproportionate customer contact
- third-party timeouts cluster by channel
- internal latency is being attributed externally

The decision is which supplier relationship requires evidence gathering or a formal service review. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Thanks
