Follow-up: the currency exposure needs a customer-behaviour view

Morning,

I need help with something that sounds simple but probably is not.

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:

1. What would we expect to see if cross-border-enabled accounts are not the same as active cross-border users?
2. What evidence would instead support that a small group of customers drives most foreign-currency activity?
3. How do we rule out that loan participations explain part of the flow?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2022 as the new evidence point rather than recycling the earlier conclusion. Please work towards whether to improve forecasting assumptions or investigate specific flow concentrations. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. One caution: This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Regards
