Follow-up: can we learn whether the campaign caused anything?

Morning,

I need help with something that sounds simple but probably is not.

Analytics has been asked to report campaign success, but selected customers may already have been more likely to convert. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

The questions I would ask in the room are:

1. What would we expect to see if service problems suppress otherwise suitable offers?
2. What evidence would instead support that targeting explains the apparent lift?
3. How do we rule out that the campaign creates incremental response?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2022 as the new evidence point rather than recycling the earlier conclusion. Please work towards the treatment, control, success window and guardrail measures before the next campaign launches. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use campaign design and customer responses; monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions. One caution: Historical campaign responses alone do not identify causal impact where no comparable control group exists.

Regards
