Follow-up: audit wants the exceptions that became normal

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Audit is testing whether approvals, declines, restrictions and collections outcomes are consistent with recorded policy inputs. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Could the answer be that overrides are rare and explainable? Or are we actually seeing that missing data looks like an override? I also do not want us to miss the possibility that a channel or period has a materially different decision pattern.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2022 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the sample for process-owner walkthroughs and policy evidence. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; monthly account snapshots, status events, limits, product enrolments and signatories; collections cases, promises to pay and recovery payments; monthly customer and KYC snapshots. The files do not contain every approval authority or policy version; flag unexplained differences rather than declaring misconduct.

Regards
