The model may be penalising the way a customer entered the bank

Team,

Before this becomes another standing report, can we answer the real question?

Model Risk is concerned that channel, document availability and data completeness may become proxies for customer groups rather than genuine risk. The possible stories are that branch and digital populations differ before modelling, that performance gaps disappear after controlling for product and income, or that missing documents drive predictions.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Please prepare a short decision pack with no more than five slides and an attached evidence table. The output must help us decide which features need restriction, monitoring or clearer business justification.

Data available: monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments.

Please state the limitation plainly: Protected-attribute analysis must be governed and access-controlled; do not use ethnicity or gender for targeting or adverse treatment.

Thanks
