Follow-up: dormancy may begin during onboarding

Hi team,

Product wants to understand why some customers make an initial deposit but fail to establish recurring activity.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- the account was opened for a one-off purpose
- activation friction causes early dormancy
- fees or a failed first journey discourage use

The decision is which onboarding intervention or product proposition should be tested. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; available initial-deposit records up to the request date; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The data cannot observe the customer's relationship with competing banks.

Thanks
