Follow-up: does closure propagate to every downstream process?

Team,

Before this becomes another standing report, can we answer the real question?

Internal Audit wants to test whether an account status change consistently stops transactions, ATM access, debit orders, collections and campaigns. The possible stories are that manual exceptions are not documented consistently, that some downstream systems lag, or that controls propagate on the same day.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Please prepare a model-ready table, data dictionary and an honest baseline. The output must help us decide whether this is an isolated exception, a design weakness or a control operating failure.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments; campaign design and customer responses.

Please state the limitation plainly: The result is a data-based control test and still requires process-owner evidence.

Thanks
