Follow-up: card blocks need a customer-harm view

Team,

Before this becomes another standing report, can we answer the real question?

Card blocking protects customers, but repeated legitimate attempts and later complaints may reveal controls that are too blunt. The possible stories are that blocked cards follow genuinely unusual sequences, that ordinary PIN errors create avoidable blocks, or that customers receive inconsistent recovery paths.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Please prepare a working Excel file with the exception population and clear columns. The output must help us decide where thresholds, escalation or customer communication should change.

Data available: ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions.

Please state the limitation plainly: Do not label a block as incorrect without the rule decision and investigation outcome.

Thanks
