Follow-up: ageing operational exceptions by customer harm

Team,

Before this becomes another standing report, can we answer the real question?

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count. The possible stories are that small-value cases remain open because ownership is unclear, that older cases cluster in one process, or that status updates close records without resolving the transaction.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide the exception priority rule and escalation threshold.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories.

Please state the limitation plainly: Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Thanks
