Follow-up: new column, renamed field or changed meaning?

Hi,

This came up in a working session and nobody had the same definition.

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: renamed or recoded fields break history; null patterns reveal a source rollout rather than missing customer data; or new fields are additive.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2022 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the data contract, quarantine rule and backfill requirement. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Thank you
