Follow-up: which branch visits are fixing another process?

Morning,

I need help with something that sounds simple but probably is not.

Regional managers suspect that statement requests, card problems and failed digital journeys are creating avoidable branch demand. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

The questions I would ask in the room are:

1. What would we expect to see if service failures drive repeat visits?
2. What evidence would instead support that customers prefer branch for complex needs?
3. How do we rule out that specific communications fail to explain the next step?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2022 as the new evidence point rather than recycling the earlier conclusion. Please work towards which demand should be removed, redirected or staffed differently. A useful output would be a working Excel file with the exception population and clear columns.

Use customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: There is no branch queue-time or staff-roster table; infer demand drivers, not staffing productivity.

Regards
