Follow-up: reissue, activation and first-use journey

Hi,

This came up in a working session and nobody had the same definition.

Card Operations needs to know whether replacement cards become usable quickly and whether old-card attempts continue after reissue.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: old credentials continue to generate declines; customers resume normal use quickly; or ATM and transaction channels reflect card history differently.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2022 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which reissue controls or customer messages need improvement. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions. Card numbers are historical lists in the account snapshot; use issue and expiry dates to determine the active card.

Thank you
