Follow-up: historical file does not always mean historical truth

Team,

Before this becomes another standing report, can we answer the real question?

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models. The possible stories are that records preserve true as-at state, that CDC fragments and snapshots are being combined incorrectly, or that closure or status fields are backfilled.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2022 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide which fields need event tables, effective dating or restricted use.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields.

Please state the limitation plainly: Do not assume a file path date is the effective date of every field.

Thanks
