Follow-up: participation cash flows are not following the simple story

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Treasury and Lending need to understand whether originated, serviced and participated loans behave differently after booking. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Could the answer be that risk share and customer behaviour are being confused? Or are we actually seeing that participated loans have different payment timing? I also do not want us to miss the possibility that servicing-bank arrangements create operational exceptions.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2022 as the new evidence point rather than recycling the earlier conclusion. The practical decision is whether participation terms, servicing controls or reporting need to change. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from loan participation and servicing records available by the request date; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments. The files support servicing and behavioural analysis, not external-bank accounting or legal settlement confirmation.

Regards
