### Follow-up: conversion is not the same as campaign impact

---

Morning,

I need help with something that sounds simple but probably is not.

Analytics has been asked to report campaign success, but selected customers may already have been more likely to convert. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

The questions I would ask in the room are:

1. What would we expect to see if targeting explains the apparent lift?
2. What evidence would instead support that the campaign creates incremental response?
3. How do we rule out that service problems suppress otherwise suitable offers?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2022 as the new evidence point rather than recycling the earlier conclusion. Please work towards the treatment, control, success window and guardrail measures before the next campaign launches. A useful output would be a one-page finding note plus the underlying CSV for our own review.

Use campaign design and customer responses; monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions. One caution: Historical campaign responses alone do not identify causal impact where no comparable control group exists.

Regards
