Can the KYC population be reproduced without manual repair? - 2022 control review

Team,

Before this becomes another standing report, can we answer the real question?

Regulatory Reporting needs a reproducible population of active, restricted and closed accounts with the relevant customer due-diligence fields. The possible stories are that status changes are not applied consistently, that company and individual rules are being mixed, or that snapshot timing explains the difference.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2022 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Please prepare a model-ready table, data dictionary and an honest baseline. The output must help us decide the agreed population rule, data-quality exceptions and evidence trail.

Data available: monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories.

Please state the limitation plainly: The dataset can test completeness and consistency, not determine whether every document is authentic.

Thanks
