Follow-up: one obligation, several attempts, unclear customer impact

Hi,

This came up in a working session and nobody had the same definition.

Payment attempts, reversals and late postings can create apparent duplicates or genuine duplicate customer impact.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: retries are correctly linked; some customers were debited more than once before reversal; or late settlement creates false duplicates.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2022 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the matching rule, customer-impact list and preventive control. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions. Statement evidence is available only for selected accounts; use transaction identifiers and timing for the full population.

Thank you
