Follow-up: A failed debit may be a calendar problem

Morning,

I need help with something that sounds simple but probably is not.

Payments wants to test whether collection timing, rather than inability to pay, explains repeat debit-order failure. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

The questions I would ask in the room are:

1. What would we expect to see if fixed collection rules work differently across customer groups?
2. What evidence would instead support that collection before regular inflow drives failure?
3. How do we rule out that retry timing improves success?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2023 as the new evidence point rather than recycling the earlier conclusion. Please work towards whether to test alternative debit dates or change retry logic. A useful output would be a working Excel file with the exception population and clear columns.

Use debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments. One caution: Regular inflows are inferred from transaction patterns; no verified payroll calendar is available.

Regards
