Follow-up: bundle uptake versus useful activity

Morning,

I need help with something that sounds simple but probably is not.

Product bundles are recorded at account level, but Pricing needs to know whether customers use optional features and remain active. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

The questions I would ask in the room are:

1. What would we expect to see if optional products deepen activity?
2. What evidence would instead support that some bundles increase service contact without increasing use?
3. How do we rule out that default products are mistaken for cross-sell?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2023 as the new evidence point rather than recycling the earlier conclusion. Please work towards which bundle components should be retained, repriced or removed from campaigns. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; campaign design and customer responses. One caution: Product enrolment is not the same as product usage; define observable use before measuring adoption.

Regards
