Why did the payment fail, and who owns the fix? - 2023 control review

Team,

Before this becomes another standing report, can we answer the real question?

Operations is grouping all failed payments together even though the next action depends on the actual cause. The possible stories are that third-party or bank timeout explains the event, that insufficient funds explains the event, or that mandate status or retry sequencing explains the event.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2023 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Please prepare a model-ready table, data dictionary and an honest baseline. The output must help us decide the operational owner, customer message and monitoring rule for each failure family.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions.

Please state the limitation plainly: Do not infer a technical component failure beyond the error and timing fields available.

Thanks
