Follow-up: please connect the outage to customer outcomes

Hi,

This came up in a working session and nobody had the same definition.

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: latency rises before visible failure; a small terminal or channel group creates most harm; or customers retry across channels and create duplicates.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is incident priority, root-cause ownership and the customer-remediation population. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The dataset has channel and ATM telemetry, not complete application, server or network logs.

Thank you
