Which source change silently changed the business answer? - 2023 control review

Morning,

I need help with something that sounds simple but probably is not.

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

The questions I would ask in the room are:

1. What would we expect to see if null patterns reveal a source rollout rather than missing customer data?
2. What evidence would instead support that new fields are additive?
3. How do we rule out that renamed or recoded fields break history?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2023 as the new evidence point rather than recycling the earlier conclusion. Please work towards the data contract, quarantine rule and backfill requirement. A useful output would be a control view with the exceptions, owner and reason each item was included.

Use monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. One caution: A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Regards
