How stable are our retail inflows? - 2023 control review

Hi team,

ALM wants a directional view of retail funding stability based on transaction behaviour and account persistence.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2023 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- large opening deposits overstate durable funding
- salary-like and recurring inflows are more stable
- customers with service problems move money out faster

The decision is which behavioural assumptions deserve formal modelling when balance and regulatory data become available. Please give us a model-ready table, data dictionary and an honest baseline.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; available initial-deposit records up to the request date; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. There are no daily account balances, wholesale funding positions or regulatory cash-flow buckets, so do not calculate LCR or NSFR.

Thanks
