Are customer retries making incidents worse? - 2023 control review

Hi team,

During service degradation, repeated attempts can inflate volume and obscure the number of customers actually affected.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2023 as the new evidence point rather than recycling the earlier conclusion. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Can you test these explanations rather than choosing one at the start?

- channel switching follows a timeout
- automatic retry and human retry are being mixed
- customers retry the same action within minutes

The decision is how monitoring should count affected customers and when retry controls should activate. Please give us a working Excel file with the exception population and clear columns.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency. Without application session IDs, use account, amount, channel and time proximity as an explicit matching heuristic.

Thanks
