Vendor performance without a vendor master - 2023 control review

Hi,

This came up in a working session and nobody had the same definition.

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: repeat incidents create disproportionate customer contact; internal latency is being attributed externally; or third-party timeouts cluster by channel.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which supplier relationship requires evidence gathering or a formal service review. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Thank you
