Follow-up: the queue may begin outside the branch

Hi,

This came up in a working session and nobody had the same definition.

Regional managers suspect that statement requests, card problems and failed digital journeys are creating avoidable branch demand.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: service failures drive repeat visits; specific communications fail to explain the next step; or customers prefer branch for complex needs.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which demand should be removed, redirected or staffed differently. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. There is no branch queue-time or staff-roster table; infer demand drivers, not staffing productivity.

Thank you
