Did digital adoption remove friction or move it? - 2023 control review

Morning,

I need help with something that sounds simple but probably is not.

Product needs to define successful channel adoption as sustained useful activity rather than enrolment or one event. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:

1. What would we expect to see if adoption differs by product and customer need?
2. What evidence would instead support that customers return to assisted channels after failure?
3. How do we rule out that first successful use predicts continued use?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2023 as the new evidence point rather than recycling the earlier conclusion. Please work towards which onboarding journey and success metric should change. A useful output would be a short decision pack with no more than five slides and an attached evidence table.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency. One caution: Available data supports channel behaviour but not every app screen, click or abandoned session.

Regards
