Which service fails first under operating stress? - 2023 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

The resilience plan lists systems, but customers experience end-to-end services that cross ATM, card, transaction and communication processes. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Could the answer be that recovery restores authorisation before posting catches up? Or are we actually seeing that cash access degrades before account servicing? I also do not want us to miss the possibility that manual workarounds create later reconciliation breaks.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2023 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the order in which critical services should be recovered and tested. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations. Treat this as a historical service-impact rehearsal, not proof of infrastructure capacity.

Regards
