Which promises are realistic at the moment they are made? - 2023 control review

Team,

Before this becomes another standing report, can we answer the real question?

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality. The possible stories are that channel and timing affect outcomes, that affordable promises are kept more often, or that partial payments are being treated inconsistently.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2023 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a model-ready table, data dictionary and an honest baseline. The output must help us decide the promise definition, coaching view and model target.

Data available: collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions.

Please state the limitation plainly: Do not rank individual collectors without workload, assignment and contact-attempt history.

Thanks
