Follow-up: build the triage bridge between the SOC and Payments

Hi team,

Timeouts, host-response failures and repeated attempts can resemble malicious activity or ordinary service degradation.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2023 as the new evidence point rather than recycling the earlier conclusion. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Can you test these explanations rather than choosing one at the start?

- operational retries are obscuring the original event
- a concentrated account or terminal pattern suggests abuse
- technical failure explains the cluster

The decision is the minimum evidence needed to route an alert to Cyber, Fraud, Payments or Infrastructure. Please give us a working Excel file with the exception population and clear columns.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency. This is triage design from available telemetry, not a substitute for SOC, firewall or application logs.

Thanks
