Quick question: is the correspondent relationship creating repeated operational risk?

Morning,

I need help with something that sounds simple but probably is not.

A small set of intermediary banks appears in settlement delays and routing alerts, raising both service and risk questions. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if beneficiary patterns explain the alerts?
2. What evidence would instead support that the operational and financial-crime populations overlap only partly?
3. How do we rule out that one intermediary drives most delay?

Please work towards whether to escalate the correspondent, change monitoring or gather contractual evidence. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use SWIFT messages, correspondent alerts and nostro breaks; transaction-level timestamps, channels, amounts, statuses and error context. One caution: Exception files do not contain the full correspondent contract or all successful traffic.

Regards
