The incident clock and the customer clock are not the same - 2023 control review

Hi team,

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2023 as the new evidence point rather than recycling the earlier conclusion. The timing also overlaps with Prolonged Stage 6 load shedding returns. Treat that as context to test, not an answer.

Can you test these explanations rather than choosing one at the start?

- a small terminal or channel group creates most harm
- customers retry across channels and create duplicates
- latency rises before visible failure

The decision is incident priority, root-cause ownership and the customer-remediation population. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The dataset has channel and ATM telemetry, not complete application, server or network logs.

Thanks
