Schema drift is becoming a reporting risk - 2023 control review

Team,

Before this becomes another standing report, can we answer the real question?

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift. The possible stories are that renamed or recoded fields break history, that new fields are additive, or that null patterns reveal a source rollout rather than missing customer data.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2023 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Please prepare a model-ready table, data dictionary and an honest baseline. The output must help us decide the data contract, quarantine rule and backfill requirement.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields.

Please state the limitation plainly: A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Thanks
