The day-end cut-off is producing two versions of the truth - 2023 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Finance and Operations are reconciling the same activity to different days because authorisation, posting and statement dates do not always line up. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Could the answer be that retries or reversals are being counted twice? Or are we actually seeing that most breaks are timing differences? I also do not want us to miss the possibility that a specific channel is posting outside the expected cut-off.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2023 as the new evidence point rather than recycling the earlier conclusion. The practical decision is whether matching rules, cut-off times or source ownership must change. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations. Statements are only available for selected accounts and months; use them as evidence samples, not as the population denominator.

Regards
