## Reduce false positives without weakening controls - 2023 control review

---

Hi,

This came up in a working session and nobody had the same definition.

Investigators report that some suspicious patterns disappear once transaction timing, retries and customer contacts are reconstructed.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: repeated attempts inflate velocity; bank-side delay creates impossible sequences; or a known service interaction explains the change.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which alert features should be corrected, retained or routed elsewhere. Please bring a short decision pack with no more than five slides and an attached evidence table, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; monthly account snapshots, status events, limits, product enrolments and signatories. A plausible explanation is not automatic clearance; investigators still own the decision.

Thank you
