The timeout field is not an SLA report - 2023 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Could the answer be that repeat incidents create disproportionate customer contact? Or are we actually seeing that third-party timeouts cluster by channel? I also do not want us to miss the possibility that internal latency is being attributed externally.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2023 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which supplier relationship requires evidence gathering or a formal service review. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Regards
