Monthly snapshots are leaking later knowledge - 2023 control review

Hi,

This came up in a working session and nobody had the same definition.

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: records preserve true as-at state; CDC fragments and snapshots are being combined incorrectly; or closure or status fields are backfilled.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which fields need event tables, effective dating or restricted use. Please bring a short decision pack with no more than five slides and an attached evidence table, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. Do not assume a file path date is the effective date of every field.

Thank you
