The oldest issue may not be the largest one - 2023 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Could the answer be that status updates close records without resolving the transaction? Or are we actually seeing that older cases cluster in one process? I also do not want us to miss the possibility that small-value cases remain open because ownership is unclear.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2023 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the exception priority rule and escalation threshold. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories. Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Regards
