Where are we paying twice to serve the same customer? - 2024 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Could the answer be that a small set of broken journeys creates most repeat contact? Or are we actually seeing that digital journeys are resolving customer needs? I also do not want us to miss the possibility that customers begin digitally and finish through an assisted channel.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which journeys should be fixed before another channel-adoption campaign is funded. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Regards
