Quick question: where does self-service hand the customer a new problem?

Team,

Before this becomes another standing report, can we answer the real question?

Digital containment is being reported as success even when customers later call, visit a branch or complain. The possible stories are that contained contacts resolve the need, that handover occurs too late, or that certain intents should begin with an agent.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Please prepare a working Excel file with the exception population and clear columns. The output must help us decide which intents belong in self-service and how success should be measured.

Data available: customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories.

Please state the limitation plainly: Containment is a proxy; use repeat contact and observable outcomes rather than claiming customer satisfaction.

Thanks
