Can we learn whether the campaign caused anything? - 2024 control review

Hi,

This came up in a working session and nobody had the same definition.

Analytics has been asked to report campaign success, but selected customers may already have been more likely to convert.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: targeting explains the apparent lift; the campaign creates incremental response; or service problems suppress otherwise suitable offers.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2024 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the treatment, control, success window and guardrail measures before the next campaign launches. Please bring a one-page finding note plus the underlying CSV for our own review, including a few cases we can trace from source to conclusion.

The available evidence is campaign design and customer responses; monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions. Historical campaign responses alone do not identify causal impact where no comparable control group exists.

Thank you
