Deposit reporting readiness from the account data

Team,

Before this becomes another standing report, can we answer the real question?

Reporting wants to test whether customer type, account type, currency, status and ownership fields can support a future deposit population. The possible stories are that joint and company accounts need separate treatment, that missing ownership or currency fields create the main exceptions, or that product classifications are consistent.

We looked at a version of this before. For the April 2024 review, please show what changed and whether the earlier conclusion still holds. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide the data remediation backlog before formal regulatory logic is implemented.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; account signatory and ownership-role records.

Please state the limitation plainly: No daily balances or official deposit-insurance rules are encoded here; assess data readiness only.

Thanks
