Channel handover and unresolved intent

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Digital containment is being reported as success even when customers later call, visit a branch or complain. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Could the answer be that contained contacts resolve the need? Or are we actually seeing that handover occurs too late? I also do not want us to miss the possibility that certain intents should begin with an agent.

We looked at a version of this before. For the April 2024 review, please show what changed and whether the earlier conclusion still holds. The practical decision is which intents belong in self-service and how success should be measured. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories. Containment is a proxy; use repeat contact and observable outcomes rather than claiming customer satisfaction.

Regards
