A resilience rehearsal using real customer journeys - 2024 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

The resilience plan lists systems, but customers experience end-to-end services that cross ATM, card, transaction and communication processes. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Could the answer be that cash access degrades before account servicing? Or are we actually seeing that recovery restores authorisation before posting catches up? I also do not want us to miss the possibility that manual workarounds create later reconciliation breaks.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the order in which critical services should be recovered and tested. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations. Treat this as a historical service-impact rehearsal, not proof of infrastructure capacity.

Regards
