Payment retries need an outcome-level control - 2024 control review

Hi,

This came up in a working session and nobody had the same definition.

Payment attempts, reversals and late postings can create apparent duplicates or genuine duplicate customer impact.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: retries are correctly linked; late settlement creates false duplicates; or some customers were debited more than once before reversal.

The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2024 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the matching rule, customer-impact list and preventive control. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions. Statement evidence is available only for selected accounts; use transaction identifiers and timing for the full population.

Thank you
