ATM failure is becoming branch workload - 2024 control review

Team,

Before this becomes another standing report, can we answer the real question?

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption. The possible stories are that cash-bin or host issues dominate, that customers switch to smaller withdrawals or branch contact, or that specific provinces show repeat access failure.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2024 as the new evidence point rather than recycling the earlier conclusion. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide where contingency communication and ATM support should be prioritised.

Data available: ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots.

Please state the limitation plainly: The data does not contain branch cash holdings or queue time.

Thanks
