Quick question: which account classifications will break the return?

Hi team,

Reporting wants to test whether customer type, account type, currency, status and ownership fields can support a future deposit population.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2024 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Can you test these explanations rather than choosing one at the start?

- product classifications are consistent
- missing ownership or currency fields create the main exceptions
- joint and company accounts need separate treatment

The decision is the data remediation backlog before formal regulatory logic is implemented. Please give us a working Excel file with the exception population and clear columns.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; account signatory and ownership-role records. No daily balances or official deposit-insurance rules are encoded here; assess data readiness only.

Thanks
